

Figure 1: Feasibility gaps of federated private ADMM [Cyffer et al. 2023], private ADMM [Chan et al. 2024] and private PADM (ours) at 1000-th iteration under eight privacy budgets ϵ_{DP} . The real-world experiment is conducted with the following model $F(\mathbf{x}) := \frac{1}{n} \sum_{k=1}^n \ln(1 + \exp(-b^{(k)} * \mathbf{R}^{(k)} \mathbf{x}))$, $g(\mathbf{y}) := \kappa_1 \|\mathbf{y}\|_1 + \frac{\kappa_2}{2} \|\mathbf{y}\|_2^2$ on the Adult data set from the UCI Machine Learning Repository: <https://archive.ics.uci.edu/dataset/2/adult>. **The two ADMM methods are infeasible while our PADM is always feasible in both cases.**

Table 1: Feasibility gaps of federated private ADMM [Cyffer et al. 2023], private ADMM [Chan et al. 2024] and private PADM (ours) at 1000-th iteration under eight privacy budgets ϵ_{DP} . **The two ADMM methods are infeasible while our PADM is always feasible in both cases.**

Synthetic Experiment
